

Daily Oil

Love her or hate her...

Margaret Thatcher understood the risk of climate breakdown. Addressing the United Nations General Assembly in 1989, she described the threat to the environment as the most urgent and important challenge to world communities. On growth, she said...

"...it must be growth which does not plunder the planet today and leave our children to deal with the consequences tomorrow"

Imagine if Thatcher's advice had been heeded by Governments three decades ago.

What went wrong?

Transcript of
Thatcher's speech

Introducing the climate dinosaurs

Nigel Lawson (deceased), famous for his scepticism of man-made climate change, was the Chancellor in 1989 and founded the oil funded Global Warming Policy Foundation to delay the transition to green energy. He ***did not want to slow down economic growth to prevent what might be happening***. The Mail also platformed his campaigns for fracking and Brexit.

Dominic Lawson (Nigel's son), a columnist with the Mail, stated that ***global warming is "a good thing for species, including humans"*** He regularly writes to undermine Net Zero policy

Rupert Darwall, platformed by the Mail, is a leading and extreme climate science denier who has called for ***the end of the 'insane green ideology' 'climate hysteria' and 'climate alarmism'***.

Ross Clark, platformed by the Mail, has written that ***"there might even be some benefits from a warming climate [...] such as the ability to grow a richer variety of crops in Britain, but this tended to go missing from the reporting"***. He regularly writes to undermine Net Zero policy.

We have yet to find an environmental commentary piece by a real climate scientist to balance the opinions of these dinosaurs.
Is this good journalism?

Oh shit! The economy!!

Get serious - drop the climate dinosaurs!
