

The Telegraph

The nation's favourite oily rag

The start of 2025 has seen a torrent of reporting on the worsening state of our climate. What have we heard from one of our most established broadsheet papers?

DEAFENING SILENCE

Not convinced?

In none of the recent articles above (and many more) that tackle the subject of fossil fuels is there even a mention of the impact of the world failing to reduce emissions in the short term. In fact, the argument appears to be 'grab what you can while you can'.

For a more informed view of the state of the world, see below:

NewScientist
Environment
The world is on track for between 1.9 and 3.7°C of warming by 2100
While some progress has been made in limiting greenhouse gas emissions, we are on the path for high levels of global warming
By Michael Le Page
24 January 2025

NewScientist
Environment
Surge in ocean heat is a sign climate change is accelerating
The rate of warming in the oceans has more than quadrupled since 1985, suggesting global warming in general has undergone a marked acceleration
